Semantic Annotations for Biological Models

This Python package is a [Py4J](#) wrapper for [SemGen](#), a package for annotating biological models with semantic information precisely describing the chemistry and physics behind a particular model. Usage of this software allows the math behind a model (differential equations and rates of change) to be traced back to the biology (what a particular variable represents - mRNA, protein, metabolite). Chemical species can be traced back to their respective molecular structures via [ChEBI](#) ids, and proteins can be traced back to their respective entries in the [Protein Ontology](#).

This type of auditing is quite common for curated model repositories such as [BioModels](#). However, a crucial feature of SemGen is support new and more expressive types of annotations. Consider the following not unlikely scenario based on a model by [Smith, Chase, Nokes, Shaw and Wake \(2004\)](#). The model describes blood flow in the four chambers of the heart. This process can be described by annotating the model element for blood with [FMA:9670](#). However, in order to describe the physical location of the element for bloody (say, the left ventricle), we need to create a new entity with a separate annotation pointing to [FMA:9466](#) (left ventricle). SemGen accomplishes this with the following *composite annotation*:

```
@prefix bqb: <http://biomodels.net/biology-qualifiers/> .
@prefix dc: <http://purl.org/dc/terms/> .

<./smith_chase_nokes_shaw_wake_2004.cellml#left_ventricle_V_lv>
  bqb:isVersionOf <http://identifiers.org/opb/OPB_00154> ;
  bqb:isPropertyOf <http://njh.me/#entity_0> ;
  dc:description "Left ventricular blood volume" .

<.#entity_0>
  bqb:isPartOf <http://njh.me/#entity_1> ;
  bqb:is <http://identifiers.org/fma/FMA:9670> .

<.#entity_1> bqb:is <http://identifiers.org/fma/FMA:9466> .
```

CHAPTER 2

Installing

To install pysemgen:

```
pip install pysemgen
```

You will also need the SemGen jar containing the Py4J server. You can run the server with:

```
java -classpath SemSimAPI.jar semsim.Py4J
```

CHAPTER 3

Quickstart

The Python wrapper is versioned using the `SemSimLibrary.SEMSIM_VERSION` variable from the Java API.

```
Py4J server started.
>>> import semgen
>>> print(semgen.__version__) # SemSimLibrary.SEMSIM_VERSION in Java
0.2
```

PySemgen supports loading SBML models with `semgen.load_sbml_file()`, `semgen.load_sbml_str()`. CellML models can be loaded with `semgen.load_cellml_file()`, `semgen.load_cellml_str()`. Antimony is a human-readable abstraction of SBML. If it is installed as a Python package, the function `semgen.load_antimony_str()` can be used to load an Antimony string directly. Once a model is loaded, one can iterate through the physical entities present in the model.

```
>>> from semgen import load_antimony_str
>>> model = load_antimony_str('''
... model mymodel
...   const compartment cell_comp
...   var species ATP in cell_comp, ADP in cell_comp
...   J0: ATP -> ADP; k*ATP
...   k = 1
...   ATP = 1
... end
... ''')
>>> for e in model.physical_entities:
...     print(e.name, e.metaid, e.description)
```

To iterate through the entities in a model.

```
>>> for e in model.physical_entities:
...     print(e.name, e.metaid, e.description)
```

Model elements can also be accessed by name.

```
>>> s = model.ATP
>>> r = model.J0
```

The semantic annotations for a given element can be accessed via the *terms* property. New annotations can be added using += (using the bqb:is qualifier by default).

```
>>> # clear existing terms for ATP and ADP
>>> model.ATP.terms.clear()
>>> model.ADP.terms.clear()
>>> # now add new terms for the molecules
>>> from semgen import ChEBI, GO
>>> model.ATP += ChEBI(15422) # terms can be specified using the numeric ontology term
>>> model.ADP += ChEBI.ADP # can also use common name alias
>>> model.cell_comp += GO.cell
>>> # print out the updated definition uris for our model entities
>>> for e in model.physical_entities:
...     print(e.name, e.metaid, e.description)
...     for term in e:
...         print(' ', term)
```

To specify physical properties (a type of composite annotation), locate the smith et al. model inside its [COMBINE archive](#) and then use setPhysicalProperty.

```
>>> model = load_cellml_file('smith_chase_nokes_shaw_wake_2004.omex/smith_chase_nokes_
↳ shaw_wake_2004.cellml')
>>> # set the physical property for the left ventricle
>>> model['left_ventricle.V_lv'].setPhysicalProperty(
...     term_uri=OPB(154),
...     entity_uris={FMA(9671): 'Portion of blood+1',
...                   FMA(9292): 'Cavity of right ventricle+1'},
...     desc='Fluid volume')
```

`semgen.load_sbml_str (sbml)`

Loads an SBML model from a string.

Parameters `sbml` (*str*) – The raw SBML/XML content.

Returns A SemSim model constructed from the SBML model.

Return type *ModelWrapper*

class `semgen.DataStructureWrapper (datastructure)`

Bases: `object`

description

metaid

name

setPhysicalProperty (*term_uri, entity_uris, desc=""*)

`semgen.bqb_isDescribedBy`

alias of `semgen.bqb.make_relation.<locals>.newrelation`

`semgen.CHEBI`

alias of `semgen.chebi.ChEBI`

`semgen.load_sbml_file (filename)`

Loads an SBML model from a file.

Parameters `filename` (*str*) – The name of the file to load.

Returns A SemSim model constructed from the SBML model.

Return type *ModelWrapper*

`semgen.bqb_isVersionOf`

alias of `semgen.bqb.make_relation.<locals>.newrelation`

`semgen.load_cellml_file (filename)`

Loads a CellML model from a file.

Parameters `filename` (*str*) – The name of the file to load.

Returns A SemSim model constructed from the CellML model.

Return type *ModelWrapper*

`semgen.bqb_hasVersion`

alias of `semgen.bqb.make_relation.<locals>.newrelation`

`semgen.searchbp` (*term, ontology, n_results*)

`semgen.chebi`

alias of `semgen.chebi.ChEBI`

class `semgen.OPB`

Bases: `semgen.ontology_base.OntologyHelper`

Ontology helper for the Ontology of Physics for Biology (OPB).

base_uri = `'http://identifiers.org/opb/OPB_'`

`semgen.bqb_isPropertyOf`

alias of `semgen.bqb.make_relation.<locals>.newrelation`

`semgen.bqb_isHomologTo`

alias of `semgen.bqb.make_relation.<locals>.newrelation`

`semgen.bqb_hasTaxon`

alias of `semgen.bqb.make_relation.<locals>.newrelation`

`semgen.bqb_hasPart`

alias of `semgen.bqb.make_relation.<locals>.newrelation`

`semgen.bqb_isPartOf`

alias of `semgen.bqb.make_relation.<locals>.newrelation`

class `semgen.FMA`

Bases: `semgen.ontology_base.OntologyHelper`

Ontology helper for the Functional Model of Anatomy (FMA) ontology.

base_uri = `'http://identifiers.org/fma/FMA:'`

class `semgen.GO`

Bases: `semgen.ontology_base.OntologyHelper`

Ontology helper for the Gene Ontology (GO).

base_uri = `'http://identifiers.org/obo.go/GO:'`

cell = `'http://identifiers.org/obo.go/GO:0005623'`

cytosol = `'http://identifiers.org/obo.go/GO:0005829'`

`semgen.load_antimony_str` (*sb_string*)

Loads an SBML model from an Antimony string. Antimony must be installed.

Parameters `sbml` (*str*) – An Antimony string.

Returns A SemSim model constructed from the SBML model.

Return type *ModelWrapper*

`semgen.bqb_encodes`

alias of `semgen.bqb.make_relation.<locals>.newrelation`

`semgen.bqb_hasProperty`
alias of `semgen.bqb.make_relation.<locals>.newrelation`

class `semgen.ChEBI`
Bases: `semgen.ontology_base.OntologyHelper`
Ontology helper for Chemical Entities of Biological Interest (ChEBI).
base_uri = `'http://identifiers.org/chebi/CHEBI:'`
classmethod `make_alias(id)`

`semgen.bqb_occursIn`
alias of `semgen.bqb.make_relation.<locals>.newrelation`

`semgen.bqb_is`
alias of `semgen.bqb.make_relation.<locals>.newrelation`

class `semgen.ModelWrapper(semsimmodel)`
Bases: `object`
getCellML (*base='model.xml'*)
Write out the model as CellML.
getRDF (*base='model.xml'*)
Get the model annotations as RDF.
getSBML (*base='model.xml'*)
Write out the model as SBML.
get_turtle ()
Get the model annotations as Turtle RDF.
physical_entities
Get a list of all DataStructures which have a physical property or component.

`semgen.humanize(t)`
Substitutes an alias for the URI if one exists.

`semgen.bqb_isEncodedBy`
alias of `semgen.bqb.make_relation.<locals>.newrelation`

`semgen.load_cellml_str(cellml)`
Loads a CellML model from a file.
Parameters `filename` (*str*) – The name of the file to load.
Returns A SemSim model constructed from the CellML model.
Return type *ModelWrapper*
